Stochastic Processes

Historical Background

Andrey Markov (Chebyshev was his advisor)

1906 – First paper on the subject of Markov Chains

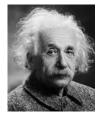

Assignment Project Exam Help

Paul Eherenfestht pist //spowcooden, comy 1900s

 Statistical interpretation of the second law of thermodynamics: The entropy of Adds We Strat powel other ease. Proposed the "Urn Model" to explain diffusion.

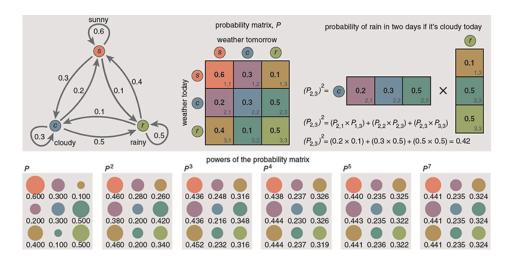

Albert Einstein: Brownian Motion, 1905

Realized Brownian (after Robert Brown 1827) motion would provide a magnifying glass into the world of the atom. Brownian motion has been extensively modeled by Markov Chains.

- A Markov Chain is a mathematical model that describes a set of states and transitions between them.
 - Each transAissignmeint iProject Dixiamf Helipg from one state to another in one step.
 - https://powcoder.com

 The transition probabilities are independent of the past, and depend only on the two states involved. The matrix of transition probabilities is called the transition matrix.

- A Markov Chain consists of three elements:
 - A State Space x =set of values the chain can take
 - Note: Your textbook uses S = State Space Exam Help
 - A Transition https://piowecodefl.comprobability of moving from state x^t to x^{t+1}
 - In general, $p_{ij}^{AddoWaribat|powership}$ of being in state x_i at step t+1 given that the process was in state x_j at step t.
 - Initial condition distribution $\pi(0)$ = probability of being in any one of the possible states at t=0.

- Weather Forecast Example:
 - Assume on any given day it is either sunny (S)or rainy (R). Therefore signment Project Exam Help

```
- Historical meteorological data reveal that: p(x^{Tomorrow} = S \mid x^{Today} = S) = 0.7
      p(x^{Tomorrow} = Add ToWye Chat powcoder
p(x^{Tomorrow} = R \mid x^{Today} = S) = 0.3
P = \begin{cases} S^{t} & 0.7 & 0.3 \\ 0.2 & 0.8 \end{cases}
      p(x^{Tomorrow} = R \mid x^{Today} = R) = 0.8
```

Transition Probability

- Initial State: Today is a sunny day $\rightarrow x^0 = [1 \ 0]$
- Note: 1 = 100% sunny and 0% rainy

• Q1: What is the probability that it will be Assignment Project Exam Help sunny tomorrow given that today is https://powcoder.com

$$\Rightarrow x^{1} = x^{0} P = \begin{bmatrix} 1 & 0 \end{bmatrix} \begin{pmatrix} \text{hat powereder} \\ 0.2 & 0.8 \end{pmatrix} = \begin{bmatrix} 0.7 & 0.3 \end{bmatrix}$$

Conclusion: There is a 70% that it will be sunny tomorrow given that it sunny today, and a 30% that it will be rainy.

• Q2: What is the probability that it will be sunny two days Assignment Project Farm Helps sunny?

$$\rightarrow x^2 = x^1 P = \text{http://poweder.com}$$

Add We Chat
$$0.7 \text{ odd} 0.3 \text{ odd} 0.3 \text{ odd} 0.3 \text{ odd} 0.2 \text{ odd} 0.8 \text{ odd} 0.8 \text{ odd} 0.2 \text{ odd} 0.8 \text{ odd} 0.8$$

Conclusion: There is a 55% that it will be sunny two days from now given that it sunny today, and a 45% that it will be rainy.

• Q3: What is the probability that it will be sunny the signment froject from that today is sunny?

today is sunny?

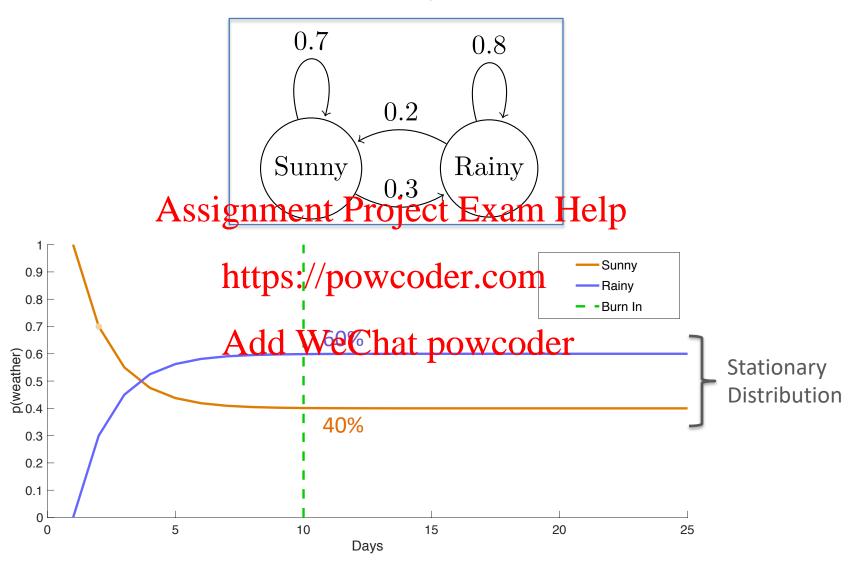

https://powcoder.com

$$\Rightarrow x^{21} = x^0 P_{Add}^{21} = \sqrt[6]{0.4} \quad 0.6$$

$$= [0.40 \ 0.60]$$

Conclusion: There is a 40% that it will be sunny two days from now given that it sunny today, and a 60% that it will be rainy.

Markov Model Representation

The **burn in** period for the Markov chain is the number of transitions it takes the chain to move from the initial conditions to the stationary distribution.

Financial Market Example:

— Assume on any given day the market is either bullish, bearish, Assignment Project, Example $x = \{Bull, Bear, Stagnant\}$

https://powcoder.com
P (To) Bull Bear Stagnant

(From) Add WeChat powcoder

Aud Wechat poweouch

 Bull
 0.900
 0.075
 0.025

 Bear
 0.150
 0.800
 0.050

 Stagnant
 0.250
 0.250
 0.500

Initial State: Today the market is Bearish $\rightarrow x^0 = [0 \ 1 \ 0]$ \rightarrow Find the steady state solution (Burn in Time)

Markov Model Representation

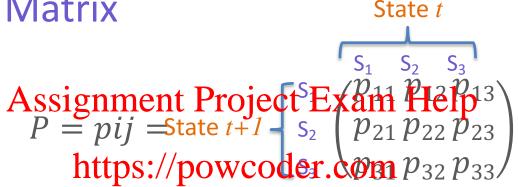

- A sequence of trials of an experiment is a Markov Chain if:
 - 1. The outcome of each experiment is one of a set of discrete states; Assignment Project Exam Help
 - 2. The outcome of an experiment depends only on the present state, and not on any past states.

Add WeChat powcoder

- If the time parameter is discrete $\{t_1, t_2, t_3, \ldots\}$, it is called Discrete Time Markov Chain (DTMC).
- If time parameter is continues, $(t \ge 0)$ it is called Continuous Time Markov Chain (CTMC).

Properties of Markov Chains

Transition Matrix

- It is square matrix ddn WeChatsplowcoodermust be used both as rows and as columns.
- All entries are between 0 and 1, because all entries represent probabilities.
- The sum of the entries in any row must be 1, since the numbers in the row give you the probability of changing from the state at the left to one of the states indicated across the top.

Types of Markov Chains

- Def: Regular Markov Chains
 - A Markov chain is a **Regular Markov** chain if some power of the the project Example positive entries. That is, if we define the (i,j) entry of P^n to be p^n_{ij} , then the Markov chain is regular if there is some n such that $p^n_{ij} > 0$ for alack). We Chat powcoder.

Example (1)

$$P = \begin{pmatrix} 0.4 & 0.6 \\ 0.4 & 0.6 \end{pmatrix}$$

 $P = \begin{pmatrix} 1/2 & 1/4 & 1/4 \\ 1/2 & 0 & 1/2 \\ 1/4 & 1/4 & 1/2 \end{pmatrix}$

All entries are positive

If you compute P², all entries are positive

Example (2)

Types of Markov Chains

Def: Absorbing Markov Chains

A state S_k of a Markov chain is called an **Absorbing State** if, once the Markov chains enters the state it remains there forever.
 Help

 A Markov chain is called an absorbing chain if It has at least one absorbing state.

https://powcoder.com

In an absorbing Markov chain, a state which is not absorbing is called

Transient.

Add WeChat powcoder
 For every state in the chain, the probability of reaching an absorbing state in a finite number of steps is nonzero.

$$P = \begin{pmatrix} 0.3 & 0.6 & 0.1 \\ 0 & \mathbf{1} & 0 \\ 0.6 & 0.2 & 0.2 \end{pmatrix}$$

$$P_{22} = 1$$
, $P_{22}^2 = 1$, ..., $P_{22}^n = 1$

Types of Markov Chains

- Def: Irreducible (or Ergodic) Markov Chains
 - A Markov chain is called an **irreducible** or **ergodic** chain if it is possible to go from to go from the first the form the first that the
 - i and j communicate if they are accessible from each other. This is written $i \leftrightarrow j$ https://powcoder.com

Example (1) Example (2) Ehrenfest's urn S₁ S₂ Add WeChat powcQder 2 3 4

$$P = \frac{S_1}{S_2} \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$$

This chain is ergodic since it is possible to move from any state to any other state

$$\mathbf{P} = \begin{array}{cccccc} 0 & 1 & 0 & 0 & 0 \\ 1/4 & 0 & 3/4 & 0 & 0 \\ 0 & 1/2 & 0 & 1/2 & 0 \\ 3 & 0 & 0 & 3/4 & 0 & 1/4 \\ 0 & 0 & 0 & 1 & 0 \end{array} \right)$$

In this example, if we start in state 0 we will, after any even number of steps, be in either state 0, 2 or 4, and after any odd number of steps, be in states 1 or 3. Thus this chain is ergodic but not regular.

Classification of States (Summary)

Let p_{jj} be the probability of returning to state j after leaving j.

- A state j is said transient if $p_{ij} < 1$
- A state j is said recurrent if $p_{p} = 1$ A state j is said absorbing if $p_{jj} = 1$
- A state j is said perjectively be an integer m > 1, called the period. A state j is said aperiodic otherwisAdd WeChat powcoder
- A Markov chain is aperiodic if the period of each state is equal to 1
- A state j is said reachable from a state i if there is a path from i to j in the state transition diagram.
- A subset S of states is said closed if there is no transition leaving S. Let T_{ii} be the average recurrent time, i.e., the time it takes to return to j
- A recurrent state j is positive recurrent if $E[T_{ij}]$ is finite.
- A recurrent state *j* is null recurrent if $E[T_{ij}] = \infty$.

Theorems

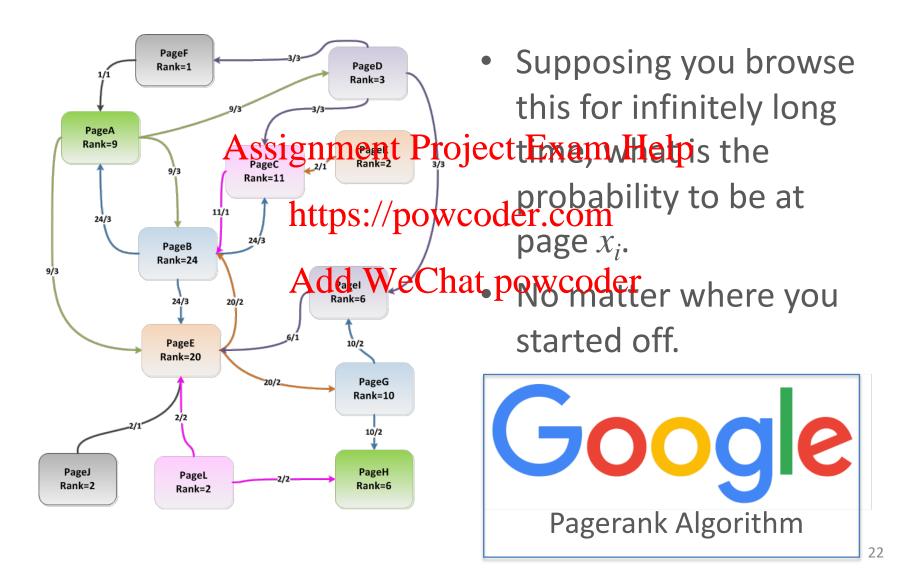

- 1. If a Markov chain has a finite state space, then at least one state is recurrent.
- 2. If i is a recurrent state and j is reachable from i, then state j is recurrent. Assignment Project Exam Help'
- 3. If S is a finite classified of the state in S is recurrent.
- 4. If i is a positive AddrWe Chat poly coder hable from i, then state j is positive recurrent.
- 5. If S is a closed irreducible set of states, then every state in S is positive recurrent or every state in S is null recurrent or every state in S is transient.
- 6. If S is a finite closed irreducible set of states, then every state in S is positive recurrent.

Design a Markov Chain on finite state space

state space Axsignment Project, Exam Help

Markov propertyps
$$p$$
/(poweoder.com $x^{(i)}$) = $T(x^{(i)} | x^{(i-1)})$

Add WeChat powcoder ...such that when simulating a trajectory of states from it, it will explore the state space spending more time in the most important regions (i.e. where p(x) is large)

Google vs. MCMC

• Google is Asis ignificant of Finjelst pexam Help

https://powcoder.com

- MCMC is given p(x) and finds T Add WeChat powcoder
- But it also needs a transition probability distribution to be specified.
- Q: Do all MCs have a stationary distribution? → No

Conditions for existence of a unique stationary distribution

- MCMC samplers are irreducible and ane ripdic MCs that converge to the target distribution
- These 2 conditions of the condition
- Reversibility (also called 'detailed balance') is a sufficient (but not necessary) that power that provided the stationary distribution.

$$p(x^t)T(x^{t-1}|x^t) = p(x^{t-1})T(x^t|x^{t-1})$$

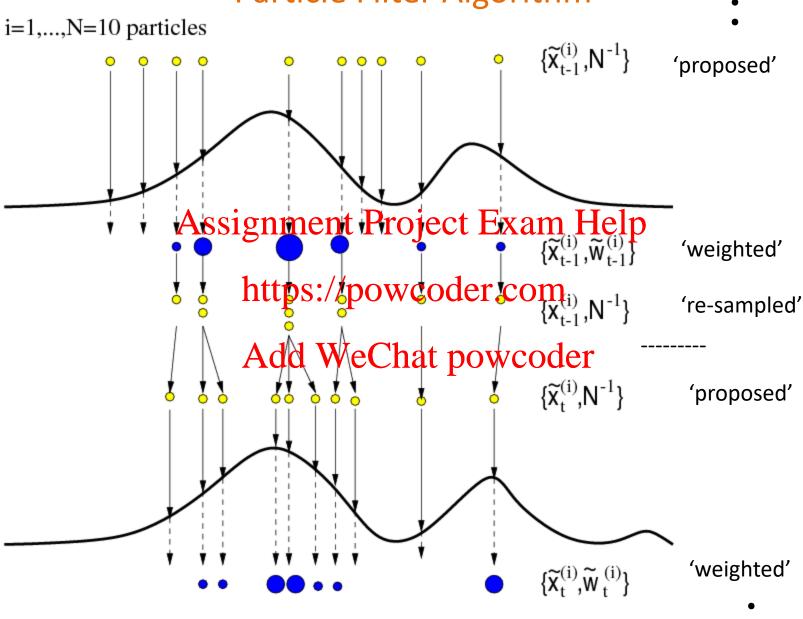

$$\to p(x^t) = \sum_{x^{t-i}} p(x^{t-1}) T(x^t | x^{t-1})$$

It is easier to work with this condition

MCMC Algorithms

- Metropolis-Hastings
- Metropolis
 - Mixtures Assignment Project Exam Help

- Adaptive MCMC

Particle Filter Algorithm

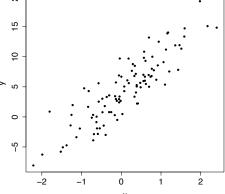

- Suppose p(x,y) is a p.d.f. or p.m.f. that is difficult to sample from directly.
 Assignment Project Exam Help
 Suppose, though, that we can easily sample
- Suppose, though, that we can easily sample from the conditional distributions p(x|y) and p(y|x). Add WeChat powcoder
- The Gibbs sampler proceeds as follows:
 - 1. Set *x* and *y* to some initial starting values
 - 2. Sample x/y, then sample y/x, then x/y, and so on.

- 1. Set (x_0, y_0) to some starting value.
- 2. Sample $x_1 \sim p(x|y_0)$, i.e., from the conditional distribution $X/Y = y_0$ Current state: Signment Project Exam Help Sample $y_1 \sim p(y|x_1)$, i.e., from the conditional distribution $Y/X = x_1$ Current state: $(x_1https://powcoder.com$
- 3. Sample $x_2 \sim p(x|y_1)$, i.e., from the conditional distribution $X|Y=y_1$ Current state: (x_2, y_1) WeChat powcoder Sample $y_2 \sim p(y|x_2)$, i.e., from the conditional distribution $Y|X=x_2$ Current state: (x_2, y_2) :

Repeat iterations 2 and 3, N times

- The conditional distribution of (X_i, Y_i) given all of the previous pairs depends on https://powcoder.com
- (x_0,y_0) chosen to be in a region of high probability under p(x,y), but often this is not so **Actor.** We Chat powcoder
- We run the chain for N iterations and discard the first B samples $(X_1,Y_1),...,(X_R,Y_R)$. This is called burn-in.
 - Typically: if you run the chain long enough, the choice of B does not matter.
- The performance of an MCMC algorithm, i.e., how quickly the sample averages converge, is referred to as the mixing rate.

- Regression Example
 - R Code: https://github.com/stablemarkets/BayesianTutorials
 - Article: https://www.r-bloggers.com/bayesian-simple-linear-regression-with-gibbs-sampling-in-f/SSIgnment Project Exam Help
- Model: $y_i \sim \hbar \phi \beta / p \phi w \beta q der.com$
- Estimate β_0 and \mathbf{A}_1 dd WeChat powcoder.
- Assume Normal priors on β_0 and β_1
- Assume Inverse Gamma on the variance ϕ

$$y_i|\beta_0, \beta_1, \phi \sim N(\beta_0 + \beta_1 x_i, \phi)$$

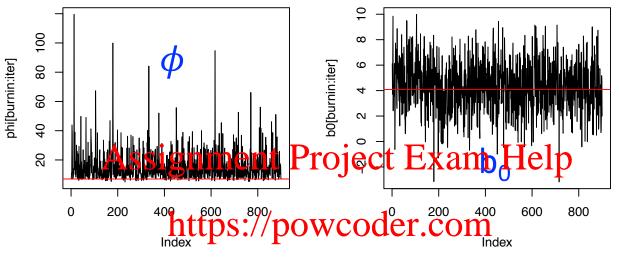

$$\beta_0|\mu_0, \tau_0 \sim N(\mu_0, \tau_0)$$

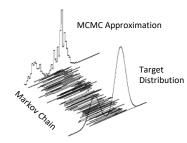

$$\beta_1|\mu_1, \tau_1 \sim N(\mu_1, \tau_1)$$

$$\phi|\alpha, \gamma \sim IG(\alpha, \gamma)$$

Bayesian Model

We will use Gibbs sampling to produces samples from the posterior distribution of each parameter of interest

$Add\ WeChat\ p_{b_0}^{\texttt{Note: LS}}\ \ \text{edim}_{4.1\ \text{and}\ b_1=5.2}^{\texttt{Settimates are}}$
